

Air-driven hydraulic pump / hydraulic power pack type LP

Product documentation

For permanent, short-period and intermittent operation and for continuous run with intermittent load (S1, S2, S3, S6)

Operating pressure $p_{\max \text{ hydr.}}$:	700 bar
Operating pressure $p_{\max \text{ pneum.}}$:	10 bar
Displacement volume $V_{\max \text{ geom.}}$:	29 cm ³ /double stroke
Delivery flow rate $Q_{\max \text{ hydr.}}$:	12 l/min
Tank volume $V_{\max \text{ tank}}$:	34 l

1 Overview of air-driven hydraulic pump / hydraulic power pack type LP

Air-driven hydraulic pumps are pneumatically driven, reciprocally acting plunger pumps. They operate as pneumatic pressure amplifiers with oscillating movement and automatic stroke reversal control.

In the case of the air-driven hydraulic pump type LP, the flow rate depends on the set air pressure and the currently effective hydraulic counter-pressure. It can drop away until the pump comes to a standstill. The pump starts up again independently once the hydraulic consumer pressure falls (maintaining pressure) or the pneumatic pressure increases further.

The hydraulic pump type LP is available as a single pump, in the cover plate version or as a hydraulic power pack with different tank sizes. Compatible, ready-for-connection, complete solutions can be assembled easily using a wide range of connection blocks and the valve banks that can be combined with them. The cover plate version is intended for use of tanks provided by the customer.

Air-driven hydraulic pump / hydraulic power pack type LP

Features and advantages

- High operating pressures
- Suitable for use in potentially explosive areas
- Energy supplied by means of compressed air
- Start-stop can be implemented via pump

Intended applications

- Machine tools
- Testing and laboratory equipment
- Hydraulic tools
- Hydraulic fixtures
- Hoisting equipment

1.1 Air-side seals made from PTFE

Air-side seals are designed with PTFE cuffs.

Features and advantages

- Low friction
- High oil delivery flow
- Excellent temperature resistance
- Low seal wear

2 Available versions

Circuit symbol

Hydraulic pump

Hydraulic power pack

The valves are examples, optional.

1) Lower pressure in case of operation as a single pump (with piping) or as a pump cover plate without tank. For operation with a higher pressure, the following applies: A tank provided by the customer with a wall thickness ≥ 1.5 mm must be implemented or operation of the single pump WITHOUT piping.

2) Higher pressures on request, only for variant without pipe module with coding X (= self-piping), see Chapter 2.3, "Pipe module".

! NOTICE

For self-piping: Make sure that the intended fittings and pipes can withstand the necessary pressure!

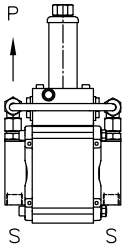

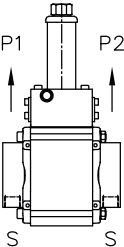

2.2 Pump version

Coding	Description	View

P	Single pump	 <p>1 Cylinder screw</p> <ul style="list-style-type: none"> ■ LP 80: Cylinder screw ISO 4762-M5x50-12.9-Geomet 321A ■ LP 125: Cylinder screw ISO 4762-M6x70-8.8-A2K ■ LP 160: Cylinder screw ISO 4762-M6x80-8.8-A2K
A	Single pump for cover plate / tank mounting	 <p>1 Grub screw (M8, hex socket AF 4)</p>
Hydraulic power pack		
D	Cover plate version	see Chapter 2.5, "Tank and cover plate"
B	Tank version	

NOTICE

Pump version P or A can be converted by replacing the screws.

2.3 Pipe module

Coding	Description	View
R8 R10	with piping <ul style="list-style-type: none"> 08S 10S 	 <p>Consolidated to one output P</p>
X	for self-piping	 <p>Individual outputs P1 and P2 for self-piping</p>

i INFORMATION

- LP 80: only R8 possible
- LP 125 and LP 160:
 - R10 = series
 - R8 = optional for the pistons -8 ... -16, reduced pressure $p_{max} = 530$ bar, downwards compatible with LP pump according to old documentation D 7280 (2000).

2.4 Intake module

i INFORMATION

The intake module is only listed in the order code with the version with cover plate or single pump.
With the tank version, the relevant appropriate intake module is installed and not also listed in the order code.

Coding	For type	Suitable for maximum clear tank height (mm)		Tank version
		H1 = depth (height) of intake module	H1 + H = total height of pump without silencer	
X	no intake module (retrofitable)			
S35	LP 80	max. 35	160	
S60		max. 60	185	
S100		max. 100	225	LP 80..B4
S200		max. 200	325	
S65	LP 125	max. 65	max. 225 *	
S75		max. 75	max. 235 *	LP 125..B4
S165		max. 165	max. 325 *	LP 125..B10

B4	D4	7	5 (4.7)	●		
		5.8	4 (3.8)		●	
B10	D10	16.6	13.5 (13.3)		●	
		13.5	11.5 (11.4)			●
B25	D25	34	29 (22)		●	
		33	28 (21)			●

* only applies to the tank version.

i INFORMATION

The values in brackets specify the approximate volume available for removal at which the optional level switch makes contact.

2.6 Level switch

Coding	Description	for tank for cover plate	Circuit symbol
X	without additional equipment	B4, B10, B25 D4, D10, D25	-
D	Level switch, N/C contact	B4, B10, B25 D4, D10	
S	Level switch, N/O contact	B4, B10, B25 D4, D10	

2.7 Level gauge

Only for tank version.

Coding	Description	for tank	Circuit symbol
X	without additional equipment	B4, B10, B25	-
K1	Level gauge position 1	B4	
K2	Level gauge position 2	B4, B10, B25	
K3	Level gauge position 3	B4	
KK2	2x level gauge (round), position 2	B4	

i INFORMATION

Mounting positions 1, 2, 3, see Chapter 4.2, "Hydraulic power pack"

2.8 Geometry

Coding	Designation	LP 80	LP 125	LP 160
X	(series)	●	●	●
D1	Cover plate variant 1, only for D4 (B4), with additional oil inlet with filler sieve see Chapter 4.2.1, "B4, D4"		●	
P1	Location of pressure port and suction port: Rotated 90° clockwise see Chapter 4.3, "Geometry"	●	●	●
P2	Location of pressure port and suction port: Rotated 180° clockwise see Chapter 4.3, "Geometry"		●	●
P3	Location of pressure port and suction port: Rotated 270° clockwise see Chapter 4.3, "Geometry"	●	●	●

i INFORMATION

- All codings Px possible for version with single pump, but not for version with tank or cover plate. After selecting one of the codings Px, only the option "X" is possible for the intake module.
- Cover plate variant D1 is not possible in combination with level switch D or S.

2.9 Pressure

Coding	Description
X	Series
A	<p>Pump with pressurised suction side, max 10 bar</p> <p>possible for version</p> <ul style="list-style-type: none"> ▪ Single pump ▪ Cover plate ▪ Tank <div style="border: 1px solid #ccc; padding: 10px; margin-top: 10px;"> <p>! NOTICE</p> <p>Option only possible for LP 125-10 and LP 160-10</p> <p>The tank is not permanently watertight. Brief maximum pressure possible in the tank.</p> <p>Sample application:</p> <ol style="list-style-type: none"> 1. If more hydraulic fluid fed back into the tank via the plunger cylinder than can be removed, this can briefly result in overpressure in the tank. The overpressure reduces again via the vent screw. 2. The suction side of the pump is pre-loaded with a separate pump. </div>

2.10 Approval

Coding	Designation
N	Standard
EX	<p>Explosion-proof version (other applicable document to be noted: B ATEX)</p> <ul style="list-style-type: none"> ▪ only for single pump

3 Parameters

NOTICE LP 80, LP 125: In the case of attachment to the flange: depending on the installation conditions, take a spacer of 5 mm into consideration, as the cylinder tube protrudes 2.5 mm over the supporting surface of the thread. see Chapter 4.3, "Geometry"</p> </div>
Ports/connections	<ul style="list-style-type: none"> P = oil pressure outlet R = oil reflux S = oil suction port (only in case of cover plate version or single pump without intake module) L = compressed-air connection
Hydraulic fluid (Hydraulics side, pump)	<p>Hydraulic fluid, according to DIN 51524 Parts 1 to 3; ISO VG 10 to 68 according to DIN ISO 3448 Viscosity range: 4 – 1100 mm²/s * Optimal operating range: approx. 4 – 200 mm²/s * Also suitable for biologically degradable hydraulic fluids type HEPG (polyalkylene glycol) and HEES (synthetic ester) at operating temperatures up to approx. +70°C. * Deviation of the values possible. Influencing factors: Viscosity, operating point, application (hydr. overall design), pump type.</p>

Cleanliness level	Recommended cleanliness as per ISO 4406, see Recommendation for hydraulic fluid: D 5488/1
Temperatures	Environment: approx. +5 ... +40 °C, hydraulic fluid: 0 ... +80 °C, ensure the correct viscosity range. Biologically degradable hydraulic fluids: note manufacturer specifications. With consideration for the seal compatibility, not above +70°C. Lower (starting) temperatures on request. Compressed air temperature: +5 ... +40 °C
Air consumption	see Chapter 3.4, "Characteristic lines"
Compressed air (air-side, drive)	compressed air prepared from commercially available service units <ul style="list-style-type: none"> ▪ Solid particles: class 7 ▪ Water: class 4 ▪ Oil: class 4 <p>The use of an improved classification of the class of water can play a role in delaying the effect of freezing. Commercially available maintenance units consisting of an air filter (filter cartridge of approx. 5 µm) with water separator, pressure reducing valve (pressure reducer), lubricator and pressure gauge are required for proper compressed-air preparation and safe and reliable functioning of the pumps. Maintenance data, see Chapter 6.1, "Maintenance unit" Operation with explosive pressurised media is not permitted.</p>

! NOTICE

The energy required to operate the air pump is supplied to the system via compressed air. When the air pump is operated, the compressed air is expanded, resulting in a cooling effect due to the expansion. The working process therefore cools the air and the pump.

If the **ambient temperature** and/or the temperature of the compressed air is below the specified **limits**, the expansion cold can cause moisture to precipitate in the form of small water droplets, which then freeze into small ice crystals. The ice crystals settle on the inside of the silencer. **The ice layer that forms then creates a dynamic pressure and brings the working process to a halt.**

In general, the likelihood of this **effect occurring is reduced** if there is **no moisture** precipitation during expansion. This is possible if **dried air is used to operate the air pump.**

3.2 Pressure and volumetric flow

Operating pressure	see Chapter 2.1, "Basic type, size and plunger pistons" see Chapter 3.4, "Characteristic lines" <ul style="list-style-type: none"> ▪ Hydraulics side, pump ▪ Air side, drive: $p_{L \max} = 10 \text{ bar}$ <div style="border: 1px solid black; padding: 5px; margin-top: 10px;"> <p>! NOTICE Make sure that the pneumatic maximum pressure is not exceeded.</p> </div>
Flow rate	see Chapter 2.1, "Basic type, size and plunger pistons"

3.3 Weight

Single pump without pipe module and without intake module	Type			<div style="border: 1px solid gray; padding: 5px;"> <p>i INFORMATION Weight depends on the size of the pump piston</p> </div>
	LP 80..X	= 4.45 kg		
	LP 125..X	= 5.89 to 6.74 kg		
	LP 160..X	= 7.95 to 8.8 kg		
Pipe module	Type			
	LP 80..R	= 0.32 kg		
	LP 125..R	= 0.52 kg		
	LP 160..R	= 0.52 kg		
Intake module	Coding			
	for LP 80:			
	S35	= 0.17 kg		
	S60	= 0.26 kg		
	S100	= 0.38 kg		
	S200	= 0.65 kg		
	for LP 125:			
	S65	= 0.29 kg

	B4	= 5.7 kg		
	B10	= 8.5 kg		
	B25	= 15.1 kg		
Cover plate	Coding			
	D4	= 2.2 kg		
	D10	= 3.1 kg		
	D25	= 6.25 kg		
Level switch	Coding			
	S, D	= 0.2 kg		

Example 1:

LP 80-10 /B4-D-K1-NBR-X..

Category	Pump	Tank	Level switch	Total weight
Selection	LP 80..X	B4	D	
Individual weights	4.45 kg	5.7 kg	0.2 kg	= 10.35 kg

Example 2:

LP 125-12 /D4-X-S250-NBR-X..

Category	Pump	Cover plate	Intake module	Total weight
Selection	LP 125..X	D4	S250	
Individual weights	5.9 kg	2.2 kg	0.86 kg	= 9.96 kg

3.4 Characteristic lines

Measured at viscosity of the hydraulic fluid 40 mm²/s

Reference values for delivery flow and pressure depending on the operating pressure *.

The reference value for the air required refers to the normal condition.

Values ±5% (hydraulic) and ±10% (pneumatic) are within the tolerance range.

* Deviation of the values possible. Influencing factors: Viscosity, operating point, application (hydr. overall design), pump type.

NOTICE

- The specified values apply for a pump commissioned after approx. 12 operating hours.
Running-in behaviour: In the case of a newly commissioned pump (especially with a low hydraulic pressure in combination with simultaneously high pneumatic pressure), the efficiency can deviate 5–25% downwards!
- When operating with a very high pneumatic flow rate (maximum performance data), the supply line has to have a sufficiently large cross-section with regard to the length in order that the required pneumatic pressure is applied to the pump. Take into account dynamic pressure!
- Dynamic pressure (for characteristic line, see ⊕): The area marked to the right of/below this characteristic line cannot be reached. This concerns the operating points with high delivery flow rates (delivery flow axis Q) and also a low hydraulic pressure (hydraulic operating pressure axis p_{Hy}). The characteristic line is not to be viewed as fixed. The values depend on the downstream hydraulic system and the associated hydraulic counter-pressure.

LP 80

Q delivery flow (l/min); p_{Hy} hydraulic operating pressure (bar); Q_L air consumption (l/min)

- 1 Stand-still pressure
- 2 Operating air pressure p_L
- 3 Air consumption at p_L
- 4 Dynamic pressure

Example At 154 bar consumer pressure p_{Hy} and 5 bar operating air pressure – an LP 80-12 achieves a flow rate Q of approx. 1.1 l/min (at an air consumption Q_L of approx. 380 l/min), see dotted spider line. The stand-still air pressure is approx. 3.9 bar (air pressure at which the pump starts to supply medium), at a consumer pressure of 154 bar.

LP 125

Q delivery flow (l/min); p_{Hy} hydraulic operating pressure (bar); Q_L air consumption (l/min)

- * Pressure $p_{max} = 700$ bar
- ** In case of pipe R8: Pressure $p_{max} = 530$ bar
- 1 Stand-still pressure
- 2 Operating air pressure p_L
- 3 Air consumption at p_L
- 4 Dynamic pressure

Example At 400 bar consumer pressure p_{Hy} and 6 bar operating air pressure, an LP 125-12 achieves a delivery flow rate Q of approx. 1.0 l/min (at an air consumption Q_L of approx. 920 l/min), see dotted spider line. The stand-still air pressure is approx. 3.8 bar (air pressure at which the pump starts to supply medium), at a consumer pressure of 400 bar.

LP 160

Q delivery flow (l/min); p_{Hy} hydraulic operating pressure (bar); Q_L air consumption (l/min)

- * Pressure p_{max} = 700 bar
- ** In case of pipe R8: Pressure p_{max} = 530 bar
- 1 Stand-still pressure
- 2 Operating air pressure p_L
- 3 Air consumption at p_L
- 4 Dynamic pressure

NOTICE

The specified values tend to be slightly worse with large piston sizes (e.g. LP 160-30) due to the dynamic pressure generated in the system.

Example At 400 bar consumer pressure p_{Hy} and 6 bar operating air pressure – an LP 160-18 achieves a delivery flow Q of approx. 1.2 l/min (at an air consumption Q_L of approx. 1050 l/min), see dotted spider line. The stand-still air pressure is approx. 5.3 bar (air pressure at which the pump starts to supply medium), at a consumer pressure of 400 bar.

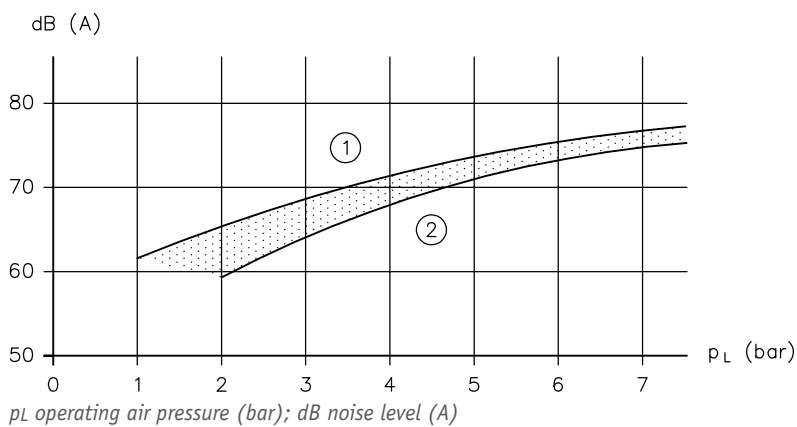

3.4.1 Running noise

Acoustic data measured at viscosity at DTE22 of $\sim 50 \text{ mm}^2/\text{s}$

Measured in the acoustic measurement chamber according to ISO 3744, distance between sound sensor and pump (d) = 1 m.

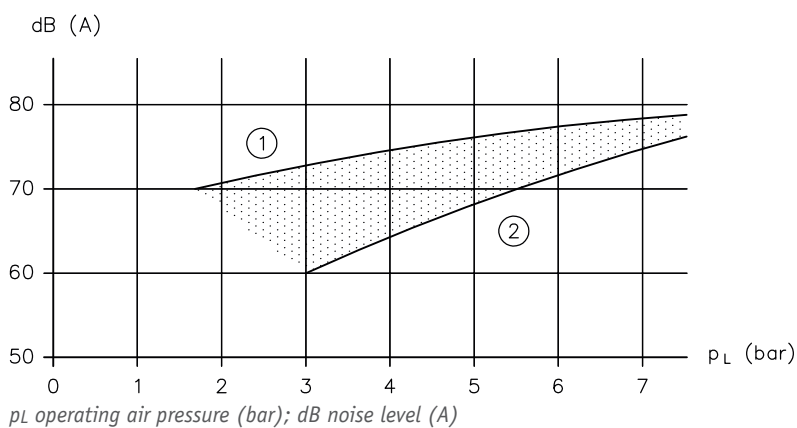

The running noise depending on the operating air pressure. The exhaust air silencer optimally reduces it.

LP 80

- 1 Hydraulic operating pressure $p = 0$
- 2 Pressure against p_{\max} (near stand-still pressure)

LP 125

- 1 Hydraulic operating pressure $p = 0$
- 2 Pressure against p_{\max} (near stand-still pressure)

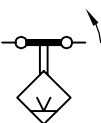

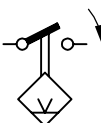

LP 160

- 1 Hydraulic operating pressure $p = 0$
- 2 Pressure against p_{max} (near stand-still pressure)

3.5 Additional options

3.5.1 Level switch

	B4, B10	B25
Max. voltage	50 V AC 70 V DC	36 V AC/DC
Max. AC/DC current	0.5 A	0.5 A
Max. AC/DC switching capacity	30 W	10 W
Electrical connection	Cable	Fitting PG 7
Circuit symbol	<p>Coding D (N/C contact)</p> 	<p>Coding S (N/O contact)</p> 

4 Dimensions

All dimensions in mm, subject to change.

4.1 Hydraulic pump

4.1.1 LP 80

- 1 Compressed-air port L: G 1/4
- 2 Silencer
- 3 Piping omitted for version LP 80-...-...-X (pump without pipe module)
- 4 Pressure connection P 2: G 1/4 for version LP 80-...-...-X (pump without pipe module)
- 5 Mounting thread B 2 for "P" assembly, for ATEX: possible grounding point
- 6 Suction port S: G 3/8: Screw-in hole similar to form X DIN 3852 Part 2
- 7 Pressure connection P 1: G 1/4 for LP 80-...-...-X (pump without pipe module)
- 8 Mounting thread B 1 for "A" assembly (screw tightening torque: max. 6 Nm)
- 9 Elbow pipe screw connection (only for variant pump with pipe module, coding R.)
- 10 Pipe screw connection T (only for variant pump with pipe module, coding R.)
- 11 High-pressure connection of seamless precision pipe (R8, pipe diameter 8 mm)

Intake module LP 80

- 1 Double nipple
- 2 Fitting, elbow
- 3 Strainer, mesh size 0.8 mm
- 4 Total installation depth

Coding

suitable for max. clear tank height

	max. H1	H1 + H = Total height of pump without silencer = Pump in tank + safety clearance

4.1.2 LP 125

- 1 Compressed-air port L: G 3/8
- 2 Silencer
- 3 Piping omitted for version LP 125-...-X (pump without pipe module)
- 4 Pressure connection P 2: G 3/8 (or G 1/4 for version LP 125-8, -10, -12, -16) (pump without pipe module)
- 5 Mounting thread B 2 for "P" assembly, for ATEX: possible grounding point
- 6 Suction port S: G 1/2: Screw-in hole similar to form X DIN 3852 Part 2
- 7 Pressure connection P 1: G 3/8 (or G 1/4 for version LP 125-8, -10, -12, -16) (pump without pipe module)
- 8 Mounting thread B 1 for "A" assembly (screw tightening torque: max. 6 Nm)
- 9 Elbow pipe screw connection (only for variant pump with pipe module, coding R.)
- 10 Pipe screw connection T (only for variant pump with pipe module, coding R.)
- 11 High-pressure connection of seamless precision pipe (pump: R10, R8 or variable, if variant LP 125-...-X (pump without pipe module), cover plate / tank version: R 10 with pipe diameter 10 mm)

LP 125	ØD	H
-8, -10, -12	75	148.5
-16, -18, -20	80	151
-25	85	153
-30	90	156
Pipe module	a	
R8	64.5	
R10	72.5	

i INFORMATION
The height H depends on the piston.

Intake module LP 125

- 1 Double nipple
- 2 Fitting, elbow
- 3 Strainer, mesh size 0.8 mm
- 4 Total installation depth

Coding	max. H1
S65	65
S75	75
S165	165
S250	250

LP 125	H	HA
-8, -10, -12	148.5	33.2
-8, -10, -12 ... R8	148.5	35.2
-16, -18, -20	151	30.7
-16 ... R8	151	32.7
-25	153	27.9
-30	156	25.2

Intake module LP 160

- 1 Double nipple
- 2 Fitting, elbow
- 3 Strainer, mesh size 0.8 mm
- 4 Total installation depth

Coding	max. H1
S85	85
S140	140
S220	220

LP 160	H	HA
-8, -10, -12	175.5	60.2
-8, -10, -12 ... R8	175.5	62.5
-16, -18, -20	178	56.7
-16 ... R8	178	59.7
-25	180	54.9
-30	183	52.2

4.2 Hydraulic power pack

4.2.1 B4, D4

- 1 Silencer
- 2 Level gauge coding K1
- 3 Level gauge coding K2
- 4 Level gauge coding K3
- 5 Level gauge coding KK2
- 6 Connection cable for level switch approx. 350 mm long
- 7 Oil drain screw G 1/8
- 8 Attachment 4x $\varnothing 9$ for the hydraulic power pack in the hydraulic system
- 9 in case of version with level switch
- 10 Pump attached to cover plate with 6x grub screw/M8 nut
- 11 Connection base P, R (hydraulic port),
see Chapter 4.4, "Hydraulic connections"

Type	a	$\varnothing b$	c	d	e	f
LP 80	88	36.7	55	26	80	127.5
LP 125	107	40.3	62	35	83	130.5

Ports (ISO 228-1)	
Type	L
LP 80	G 1/4
LP 125	G 3/8

4.2.2 B10, D10

- 1 Silencer
- 2 Level gauge coding K2
- 3 Connection cable for level switch approx. 350 mm long
- 4 Oil drain screw G 1/4
- 5 Attachment 4x $\varnothing 9$ for the hydraulic power pack in the hydraulic system
- 6 in case of version with level switch
- 7 Pump attached to cover plate with 8x grub screw/M8 nut
- 8 Connection base P, R (hydraulic port),
see Chapter 4.4, "Hydraulic connections"

Type	a	$\varnothing b$	c	d	e	f
LP 125	106.5	41	62	35	90	155
LP 160	130	56	68	45	95	197.5

Type	Ports (ISO 228-1)
LP 125	G 3/8
LP 160	G 1/2

4.2.3 B25, D25

- 1 Silencer
- 2 Level gauge coding K2
- 3 Level switch
- 4 Cable fitting Pg 7
- 5 Oil drain screw G 1/4
- 6 Attachment 4x Ø9 for the hydraulic power pack in the hydraulic system
- 7 Pump attached to cover plate with 12x grub screw/M8 nut
- 8 Connection base P, R (hydraulic port),
see Chapter 4.4, "Hydraulic connections"

Type	a	Øb	c	d	e	f
LP 125	106.5	41	62	35	90	155
LP 160	130	56	68	45	125	242.5

Type	Ports (ISO 228-1)
	L
LP 125	G 3/8
LP 160	G 1/2

4.3 Geometry

Location of pressure port and suction port

NOTICE

LP 80, LP 125:

- In the case of attachment to the flange: depending on the installation conditions, take a spacer of 5 mm into consideration, as the cylinder tube protrudes 2.5 mm over the supporting surface of the thread.

1 Wall clearance with spacers

LP 125:

- In the case of the geometry options P1, P2, P3: 2 additional threads (M6) are available on the top front face of the flange as shown in the drawings.

NOTICE

The pump cylinder can also be mounted offset by 90° respectively subsequently by the customer, see B 7280. This enables the mounting space and in particular the location of the suction and pressure lines to be optimised.
The given possible variants must be taken into account depending on the size, see Chapter 2.8, "Geometry".

4.4 Hydraulic connections

for cover plate / tank version

Type	Coding Tank / cover plate	a	b
LP 80	B4 / D4	40.5	44
	B4 / D4	41.5	47
LP 125	B10 / D10	66	40
	B25 / D25	66	90
LP 160	B10 / D10	63	36
	B25 / D25	108	56

Example: connection block C 5, C 6

INFORMATION

For further information see AB blocks: D 6905 AB, B blocks: D 6905 B, C blocks: D 6905 C. see Chapter 6.3, "Connection blocks"

Type	Coding Tank / cover plate	a	b
LP 80	B4 / D4	40.5	44
	B4 / D4	41.5	47
LP 125	B10 / D10	66	40
	B25 / D25	66	90
LP 160	B10 / D10	63	36
	B25 / D25	108	56

1 Connection block C 5 or C 6, see D 6905 C

5**Installation, operation and maintenance information****! NOTICE**

Available for this product: assembly instructions with notes on:

- intended use,
- operating and maintenance,
- Assembly information

Assembly instructions for air-driven hydraulic pump/power pack type LP: B 7280

Operating instructions for HAWE devices for designated use in potentially explosive atmospheres: B ATEX

6 Other information

6.1 Maintenance unit

Commercially available maintenance units consisting of an air filter (filter cartridge of approx. 5 µm) with water separator, pressure reducing valve (pressure reducer), lubricator and pressure gauge are required for proper compressed-air preparation and safe and reliable functioning of the pumps.

Type	Normal nominal flow (l/min)
LP 80	approx. 800
LP 125	approx. 1400
LP 160	approx. 2500

! NOTICE

Values refer to operation under the conditions:

- 6 bar air pressure
- Idle on the hydraulic side

6.2 Long running times

A pressurised gas or gas mixture cools down during sudden, adiabatic expansion. Likewise, the components in which the expansion takes place and through which the cold gas flows until it exits, also cool down.

In typical operation, the components heat up between the work cycles during downtime intervals due to the higher ambient temperature. During continuous operation, the components can cool down to such an extent that water vapour condenses on them and frost forms or icing takes place.

On the hydraulic pump type LP, the reversing valve and the exhaust air silencer can ice up during exceptionally long running times. This applies in the case of continuous operation, depending on the temperatures of the surroundings and compressed air as well as the running time and the operating point of the pump (flow rate / pressure p_{new}), in combination with air pressures larger than approx. 4 bar.

Use of antifreeze is possible if this is compatible with the seals used.

6.3 Connection blocks

A connection block is necessary to make an air-driven hydraulic power pack ready for a hydraulic connection.

i INFORMATION

When selecting one, take note of the specifications for the connection blocks and mounted directional valves.

When setting the pressure-limiting valve on the connection block, take note of the pump's and valve mounting's maximum permitted pressure.

Type	Description	Publication
without coding	Connection block is self-made, for hole pattern see Chapter 4, "Dimensions"	
AB	For single-circuit pumps with a pressure-limiting valve and the possibility of direct mounting of directional valve banks Optional: <ul style="list-style-type: none"> ▪ Pressure filter or return line filter ▪ Idle circulation valve ▪ Accumulator charging valve ▪ Proportional pressure-limiting valve 	D 6905 AB SK 6905 AD
AB..X	For single-circuit pumps with a component-approved pressure-limiting valve and the possibility of direct mounting of directional valve banks (for use in accumulator systems) Optional: <ul style="list-style-type: none"> ▪ Pressure filter or return line filter ▪ Idle circulation valve 	D 6905 AB SK 6905 AD TÜV
B	For single-circuit pumps for the activation of single-acting cylinders with a pressure-limiting valve and drain valve Optional: <ul style="list-style-type: none"> ▪ Throttle valve 	D 6905 B
C	For single-circuit pumps with connections P and R for direct piping	D 6905 C

i INFORMATION

The connection block type AB.../PMVP can be used as an idle circulation valve. Without power, the valve remains open from a minimum pressure of approx. 5 bar.

Sample application for idle circulations with solenoid valves; multiple pressure and idle intervals following in quick succession.

It may not be reasonable for the pump to be switched off during brief intervals. The pump only switches off once the complete pressure interval sequence has finished.

6.4 Directional valve banks

Mounting of valve banks with connection block

- Mounting of valve banks with connection plate **S** behind a connection block AB, B or C.

Connection plate **S** only for the valve banks VB and BWN / BWH

Example:

LP 80-10/B4-X-X-NBR-X-X-X

-AB 1 K B 380

-BWH 1 S - NN - 1 - 1 - G24

i INFORMATION

The direct mounting of valve banks with directional valves on connection blocks enables a compact hydraulic unit to be assembled without the need for additional piping.

This applies to all types except type **C**.

! NOTICE

Restrictions for weight reasons:

Maximum number of valves that are permitted be installed: 6 (higher number on request)

! NOTICE

When mounting valve banks, check for potential collisions with the silencer, in particular for type VB, BWN, BWH.

Type	Description	p _{max} (bar)	Publication
VB	Valve bank (directional seated valve)	700	D 7302
BWN, BWH	Valve bank (directional seated valve)	450	D 7470 B/1
SWR, SWS	Valve bank (directional spool valve)	315	D 7951
BA	Valve bank for the combination of different directional valves with connection pattern NG 6 in accordance with DIN 24 340-A6	400	D 7788
BVH	Valve bank (directional seated valve)	400	D 7788 BV
NBVP	Directional seated valve	400	D 7765 N
ROLV	Directional seated valve	400	D 8144
NSWP	Directional spool valve	315	D 7451 N
NSMD	Clamping module (Directional spool valve with a pressure reducing valve and acknowledge function)	120	D 7787
NZP	Intermediate plates with connection pattern NG 6 in accordance with DIN 24 340-A6	400	D 7788 Z
POL, PRL, PIL	Proportional directional spool valve	350	D 6394
PIH	Proportional directional spool valve	350	D 6418
SWPM	Directional valve	320	D 6420/1

Direct mounting of valve banks

- Direct mounting of valve banks with connection plate **L** without preceding connection block.

Possible valve banks: VB 01, VB 11 (D 7302) or BWN 1, BWH 1 (D 7470 B/1)

Example:

LP 125-16/B10-X-X-NBR-X-X-X-N

-VB 11 L P - HHH - 1
